Addendum to BL.1.03
J. M. Grochow, N. I. Morris

New control words: bind, bind-names

With the integration of segment binding and system tape generation two new control lines have been added to the MST header file:

bind: yes;

must appear if this is a header for a segment to be bound in this run ("no" if this is a bound segment but is already bound).

bind_names: α, β, γ, δ, ..., ω;

where α, β, γ, ..., are the names of the component segments. This statement must appear after the "bind:" statement.

Neither of these control lines need be present in a header for a non-bound segment.

Obsoleted control word: loadname

The new way of specifying a segment loadname is to place it in parentheses following the segment name:

name: α (β);

Where β previously would have appeared in a "loadname" statement.

Loadnames may also be specified for components of a bound segment:

bind_names: α(α'), β(β'), γ(γ');

The control word "loadname" will no longer be recognized.

In cases where it is desired to call a segment off the library, bind it, and then write it on an MST with a different name, the following may be used:

name: α [β];

where α will be the MST name and β is the library name.
In summary:

<table>
<thead>
<tr>
<th>name on library</th>
<th>in 6.36 during binder and MSTG run</th>
<th>on MST</th>
<th>control line</th>
</tr>
</thead>
<tbody>
<tr>
<td>α</td>
<td>α</td>
<td>α</td>
<td>name: α;</td>
</tr>
<tr>
<td>α</td>
<td>β</td>
<td>α</td>
<td>name: α(β);</td>
</tr>
<tr>
<td>β</td>
<td>β</td>
<td>α</td>
<td>name: α {β};</td>
</tr>
</tbody>
</table>

Neither of the loadname options is allowed on a "name" statement referring to a bound segment.

(It will be remembered that "{" is "(" on a 2741 or 1050.)
