Identification

echo
K. J. Martin

Purpose

The echo command types out the character string which is passed to it as an argument. The character string is prefaced by "echo: ".

Usage

The user types the command line

```plaintext
echo string
```

where string is a character string. It may be a simple string, e.g.,

```plaintext
echo abc
```
a literal string, e.g.,

```plaintext
echo 'typewriter output'
```
or an immediate-value command which has a character-string value, e.g.,

```plaintext
echo {wdir}
```

Implementation

The echo command concatenates "echo: " and its character-string argument, then calls write_out$nl (BY.4.02) with the resulting string.
