

To: MTB Distribution
From: Roger Lackey
Date: September 24, 1981
Subject: MR9.0 MRDS Performance Results

PURPOSE

The purpose of this MTB is to show the performance differences between MR6.5 MRDS and the MR9.0 MRDS.

I. SUMMARY RESULTS

The following table shows the relationship between MRDS 6.5 and MRDS 9.0 performance.

FUNCTION	MR6.5 TIME	MR9.0 TIME	PERCENT GAIN	TIMES FASTER
store	2.70	0.69	74.44	3.91
retrieve	274.92	103.92	62.20	2.65
modify	271.97	135.51	50.18	2.01
delete	127.52	80.10	37.19	1.59
open	23.95	8.79	63.30	2.73
close	7.80	2.64	66.15	2.96
Overall: Average			62.12	2.64 *

* Calculated by averaging the times faster for the six test categories.

Multics Project internal working documentation. Not to be reproduced outside the Multics Project.

II. SUMMARY RESULTS between MR8.0 and MR9.0 MRDS

The following table shows the percentage gain and times faster statistics for both MR8.0 and MR9.0 MRDS as measured against MR6.5 MRDS.

	MR8.0 * %GAIN	TIMES FASTER	MR9.0 %GAIN	TIMES FASTER
store	6.91	1.07	74.44	3.91
retrieve	74.86	3.98	62.20	2.65
modify	8.47	1.09	50.18	2.01
delete	11.41	1.13	37.19	1.59
open	14.46	1.70	63.30	2.73
close	-2.39	0.99	66.15	2.96
Average		1.66		2.64

The improvement between MR8.0 and MR9.0 MRDS is 1.59 times faster.

The decrease in the retrieval performance between MR8.0 and MR9.0 is attributed to the fact that these test were for a one relation database and MR9.0 has added considerable optimization for two or more relations in a selection expression.

* As published in MTB 450 for MR8.0 MRDS.

IV. TEST DESCRIPTIONS

All tests were performed against a one relation database with character data type and then against the same database but with a fixed binary data type for each attribute.

The character database described as follows:

domain: common char (20);

attribute:

```
k001 common ,  
k002 common ,  
d001 common ,  
x001 common ;
```

relation:

```
r001 (k001* k002* d001 x001);
```

index:

```
r001 (x001);
```

and the fixed binary database described as follows.

domain: common fixed_bin;

attribute:

```
k001 common ,  
k002 common ,  
d001 common ,  
x001 common ;
```

relation:

```
r001 (k001* k002* d001 x001);
```

index:

```
r001 (x001);
```

The selection expressions used in retrieve, modify and delete tests span only one relation. The tests consist of three sets: the first selects the first 10 tuples (keys 1 - 10), the middle which selects the middle 10 tuples (keys 496 - 505), and the last 10 tuples (keys 991 - 1000).

The data was acquired by a program that given a MRDS function (retrieve, modify delete, etc), a database index and where needed a selection expression, executes the test reading the virtual clock before and after the call to MRDS. It make the call to MRDS in such a way that no data conversion is encountered.

The results are expressed as a percentage improvement of new MRDS to old MRDS as calculated by the formula:

PERCENT GAIN = ((old_time - new_time) / old_time) * 100

TIMES FASTER = 100 / (100 - PERCENT GAIN)

The modify test modified a data attribute in the first test, an indexed attribute in the second test and both a data and an index attribute in the third test. A problem with MR 6.5 MRDS prevented the timing of the modifies for the character data type.

The store tests consisted of storing 1000 tuples in each of the fixed binary and character databases.

The open and close tests were run against the database with both exclusive retrieval and exclusive update opening modes.

APPENDIX A

The following is the detailed data or each test.

APPENDIX C

EFFECTS OF ATTRIBUTE LEVEL CONTROL

The purpose of this test was to determine if the implementation of attribute level control had a significant effect on the performance of MRDS. As shown by the following table the impact was negligible.

	UNSECURED DATABASE TIME	SECURED DATABASE TIME	PERCENT CHANGE
	67.45	69.45	-2.9
	15.26	15.48	-1.4
	27.88	26.93	+3.5
Total	110.59	111.86	0.8

The time were the timing results from the LINUS regression tests with the database being opened through a submodel.

The same test was also run against a MR6.5 version of the database using the same submodel with the following results:

MR6.5	UNSECURED MR9.0	PERCENT GAIN	TIMES FASTER
96.64	67.45	30.20	1.43
29.23	15.26	47.79	1.92
45.72	27.88	39.02	1.64
Total	171.59	35.55	1.55
